

NEW MUSEUM CELEBRATES THE HISTORY OF BROADCAST TECHNOLOGY

*Educational facility opens to
public in June*

Signal Kinetics Industries, a leading telecommunications research company, will open the doors to its new educational museum and visitor centre this summer. The museum aims to bring the fascinating world of broadcast technology to families and students across the region.

"We're excited to share our passion for signal science with the public," said Dr. R. Kelloway, Director of Public Interface Development at SKI. "For too long, telecommunications has been seen as dry or overly technical. We want to show people—especially young people—just how magical and important this technology really is."

The museum will feature interactive exhibits including "The History of Television," a hands-on children's area called "Signal Safari," and the "Hall of Screens" showcasing television sets from across the decades. Visitors will also have the opportunity to tour working laboratories and see broadcast equipment in action.

The new museum will be open Tuesday through Sunday, with guided tours of the SKI headquarters available on Tuesdays and Thursdays. School groups are encouraged to book in advance.

The facility represents a significant investment in public education and community outreach for Signal Kinetics Industries, which was founded in 1957 and has been at the forefront of telecommunications research for nearly two decades.

"We believe that an informed public is essential to the advancement of broadcast technology," added Dr. Kelloway. "This isn't just a museum—it's an invitation to understand the signals that shape our daily lives."
